

Together we can advance HIV research

Learn about a clinical research study evaluating an investigational medication for people living with HIV-1.

The Illuminate Studies are evaluating the safety, tolerability, and effectiveness of an investigational medication that you take once a day. Currently, a 3-drug combination is the standard of care for treating human immunodeficiency virus (HIV). These studies aim to evaluate the safety and effectiveness of a 2-drug combination therapy.

In order to participate, you must be diagnosed with HIV-1. The study staff can tell you about other requirements to participate.

Why Participate?

If you qualify and decide to participate:

- Participation is voluntary, and you are free to withdraw at any time. Your privacy will be maintained throughout the study
- There is no cost to participate, and you will receive all study medications and study-related doctor visits at no charge
- Your HIV and overall health will be closely monitored by an experienced HIV study team
- Your participation may help to advance medical knowledge about HIV and may help others

Additional potential risks and benefits of participation will be fully described by your study team.
